

## *Building Humus by speeding digestion*

*The growing power of soil rests largely with its carbon content.*

*There's lots of old leaf and crop residue to be broken down and digested in autumn – the selected microbes in GardenZest speed this process and help to form humus. Humus is the stable carbon fraction of soil that provides storage for both nutrients and moisture.*

**GardenZest** contains:-

CalciZest & DoloZest<sup>®</sup>

(CalciZest and DoloZest<sup>®</sup> supply lime & dolomite along with soft carbons and a wide range of selected beneficial fungi and bacteria.)

Elemental Sulphur

Soft phosphate rock (gradual release)

Potassium Sulphate, and the trace elements, Boron, Selenium and Cobalt

N	P	K	S	Ca	Mg	
0.0	3.8	2.2	3.3	20.4	0.7	%

Recommendation for use:-

*For general use and as a base dressing for crops, sprinkle liberally and fork well into the soil. After plants are established they may be side-dressed – scratch into the soil, and water.*

**Nutrient dense, high brix fruit and vegetables last longer.**

The measure of a healthy crop is produce with a high brix and with minimal pest or disease damage. Brix is a measure of soluble sugars. The brix level of a crop is dependent on the balanced uptake of all essential nutrients and the ability of the plant to efficiently photosynthesise.

As a result of improved physical soil structures and increased biological activity along with essential nutrients, the application of GardenZest provides the following benefits:-

- ✓ Heavier yield
- ✓ Higher brix levels
- ✓ Earlier maturity
- ✓ Reduced pest and disease pressure
- ✓ More even lawn growth and ground cover.
